We're doing our part to help raise awareness about the forgotten lumberyards of Newfoundland and Labrador. From historic mills and shops, to rivers, lakes, and trails, the province is home to a wealth of natural resources. Our story began by going back to the beginning. To preserve the province's lumber heritage, we've decided to visit some of the mills and workshops that saw the first logs from North America to be sent overseas and gain fame from their construction. 2. How will this experience shape your understanding of Newfoundland and Labrador? As a national park, Newfoundland is a land of contrasts: from working class communities to megayachts, from rural backwoods to golden beaches. The journey takes you through a land of contrasts, which are a result of a long and complicated history. The province has gained a reputation for being somewhat down-trodden, even within Canada, and this travelling experience aims to give you a richer understanding of the place. the surface of the PDMS layer. (c) PDMS-microgel disks are suspended in ethanol to achieve nanoscopic gaps for the shear trapping experiments. (d) Strain of PDMS-microgel disks trapped inside the nanoscopic gaps. The PDMS-microgel disks are not trapped by the shear flow in the first case. The shear flow applied to the PDMS surfaces causes the solvent to first go away from the PDMS surfaces before the PDMS-microgel disks cannot move. This leads to a lack of PDMS deformation on the top PDMS surface, while the microgels on the bottom PDMS surface are deformed. While the deformation on the top PDMS surface is visible, the deformation of the microgel cannot be detected because of the low signal. The elasticity of the microgels is not a factor in the first case because the substrates are initially quiescent, and the microgels have already moved over the surface of the PDMS. The microgels
