Q: Angular 2 html binding in custom service I've got a component that needs to call a service for data. I'm using the two-way data binding in the view to bind the data that the service returns. Now, I need to make a similar service that returns data and has the two-way binding. How can I do this? service.component.ts import {Http, Headers} from '@angular/http'; @Injectable() export class SimpleHtmlService { constructor(private http:Http) { } getSomeHtml(): string{ return `some html goes here `; } getSomeOtherHtml(): string{ return `some html goes here `; } } service.component.html export class MyComponent implements OnInit { html:string; ngOnInit() { } onClickHandler(){ this.html = this.simpleHtmlService.getSomeOtherHtml(); } } A: You can use either @Output or @Input or neither Change a flag in your service and then either return that value or pipe your value to the component using the (click) event I think option 2 is the cleanest solution. service.ts import { Injectable } from '@angular/core'; import {Subject} from 'rxjs/Rx'; @Inject d4474df7b8
