I have the following questions: Does java allow a class to declare a final field? Is the final field private and can there be a public constructor that sets the field to null? A: Java does not allow you to declare a final field. You could accomplish the same effect by declaring a final static field, but that's not the same as declaring a final field. I don't think the constructor is applicable. A final field has to be initialized by the declaration. The only way you can set a final field is by declaring a constructor that takes a parameter and sets that final field in the constructor. Students from the Applied Technology Department at the College of Technology took part in a Feb. 21, Penn State simulation to study the effects of light pollution and dark nights on the behavior of nocturnal birds and insects. Many of the questions focus on how light at night influences the behavior of nocturnal insects and birds, but in an effort to understand how light pollution interacts with these animals, students also completed sims to study a variety of other effects of light at night on humans and on animals and birds in everyday environments. Dr. Lois Stevens, professor of applied technology and director of undergraduate studies and direct of the Applied Technology Department, recruited graduate student Reshma Gadhia and undergraduate students from the Department of Physics and Applied Mathematics to help carry out the experiments, which were sponsored by the Purdue Undergraduate Research and Creativity Symposium. The research focuses on the role of light at night in ecologically important behaviors. Differences between behaviors related to the presence or absence of moonlight have been demonstrated in numerous studies. On the night of the study, atmospheric lighting conditions were adjusted to simulate a typical night in a temperate region (ch
