BROKEVEN ADDIN BROKEVEN ADDIN offers simple keyword search capabilities for quickly identifying Excel documents containing pricing models, such as break even analysis. Demo by Jonathan Cornfield. A: Here's what I use: "This addin smoothly incorporates break-even analysis, break-even points, break-even charts and price elasticity that will help you determine the impact of your current pricing on your business and the optimum pricing. The Revenue, Surplus, and Number of Sales are calculated for prices ranging from -50% to +50% of the current price. The model determines the Optimum Pricing to maximize your surplus and can be applied to new or established businesses, product/service lines, or individual items. It is compact, easy to use, and requires minimal inputs. Outputs include break even charts for Current, Increased, Decreased, and Optimum pricing. Each break even chart is a graphical display of the break even analysis including the break even point considering price elasticity. Extended Price Analysis determines Optimum Pricing to maximize your business surplus. The Revenue, Surplus, and Number of Sales are 70238732e0

In theory this key macro will work with any color and any background color, however I found this test to be the most accurate, it would work with the 3 colors that were left in the test. A: It is hard to be certain without seeing the image. To correct the color, you need to be able to see the pixel. If you are dealing with a transparent image (like the last image in your example) then it may be easier to just copy the image to a new location and then copy it back to replace the existing image. The following code works on a transparent image with no background, but since I don't know how much of the image is visible, I can't be certain: import Image, ImageFilter, ImageOps def toColorCode(image): # Get image g = Image.open(image) # Get foreground color f = Image.getcolors(g)[0] # Use ImageFilter to create lookup table of foreground # This might be a slow method, as it loads the whole image into memory # Also, it doesn't detect transparency, so there will be "holes" in the # colors. colorList = ImageFilter.LookupTable(g) # Pick the closest color color = colorList[f] # Convert foreground color to hexadecimal colorCode = "%02X" % color.hex # Return color code return colorCode # Iterate over images for image in images: print image, # Convert image to color code code = toColorCode(image) # Convert color code to hexadecimal hexCode = "%02X" % int(code, 16) # Set color to image image.putdata(hexCode, (0, 0, 0, 0)) # Save modified image image.save(image + "_fixed.png") # Show modified image Image.open(image + "_fixed.png").show() This code can be extended to also
