1. Field of the Invention  
The present invention relates to a printing apparatus and a method of printing. More particularly, the present invention relates to a printing apparatus and a method of printing capable of obtaining high-precision registration.

2. Description of the Related Art  
The use of inkjet printers that use inkjet printers has increased rapidly in recent years. Inkjet printers use printheads that include a nozzle row provided with nozzles that discharge ink. The inkjet printers perform printing by discharging ink from the nozzles onto printing paper. Inkjet printers include an inkjet printer that carries out printing by

---

causing a plurality of nozzles provided in the printhead to discharge ink at a time.

This type of printer often includes a scanning unit that performs reciprocating movement in a primary scanning direction across the printing paper and a carriage unit that is equipped with the printhead and moves back and forth along the primary scanning direction. This type of printer carries out printing in a method that includes driving the printhead while making the carriage unit reciprocate along the primary scanning direction, causing the nozzle row to discharge ink at a time, and moving the printing paper in the secondary scanning direction perpendicular to the primary scanning direction. In such inkjet printers, a

---

printing control device that controls the inkjet printer controls the nozzle row to discharge ink in synchronization with movement of the carriage unit. With this printing control device, after the carriage unit has moved to a predetermined location, the printhead is driven to discharge ink at a time and the printing paper is transported at a speed. The printing control device adjusts the timing of driving the printhead such that the printing paper is reliably transported at the speed corresponding to the carriage unit moving to the predetermined location. For example, Japanese Patent Laid-Open No. 6-297578 discloses an inkjet printer that carries out printing by causing a plurality of nozzles provided in

---

the printhead to discharge ink at a time.
