---

dryer, and more particularly, to an apparatus for drying articles, such as clothes, within a dryer. 2. Description of the Related Art In general, a dryer is used to dry laundry items (e.g., clothes) for a long period of time. During the drying process, the laundry items must be subjected to a drying environment, such as heat and air flow. A conventional dryer includes a drying chamber, in which the laundry items are dried, and a heater for heating air flowing in the drying chamber. However, the drying process of a conventional dryer takes a relatively long time, and the heated air may have an unpleasant odor. The laundry items may be singed or damaged by the high heat, and the conventional dryer is inefficient, because the air is heated at relatively high temperature.

Accordingly, there is a need for an apparatus for drying clothes, which is more efficient than conventional dryers.
