The basic layout of a power transfer system includes the transmission of energy through a power transfer assembly to a primary side of the power transfer system. The transmission of energy to the primary side of the power transfer system can be accomplished via a known power transfer system, e.g. a car powertrain or a consumer product powertrain. In the context of automotive applications, power transfer systems include conventional drive trains and hybrid drive trains, which may include a series-connected internal combustion engine and a motor/generator. Both the motor/generator and the internal combustion engine are referred to as electric machines.
