### **MIDI Visualizer**

MIDI Visualizer is a lightweight utility that enables you to check out, customize and export the visualization of the notes and effects stored in a MIDI file into a series of bitmap graphics. Load the MIDI files and check out the series of bitmap graphics. The application does not require installation or configuration, meaning you can access it as soon as you load the MIDI file. The interface is the strong point of the tool as the notes and effects are shown in the designated order in a modern and streamlined environment. The idea behind the utility is to enable you to visualize how the audio project would look and hence, could be a great addition to anyone passionate about music composition and DJ-ing. It goes without saying the display can be exported and used with other apps. Generally speaking, MIDI files do not contain audio data, but rather help explain what, when, how long and loud the notes should be played. In other words, these files contain instructions on how the sound should be produced when loaded into a specialized third-party app or attached to a playback device. Therefore, you should not expect the program to play the soundtracks or samples, but rather solely display them. Edit the line, color, scale and other display parameters It is worth mentioning that the program comes with a settings panel where you can customize the colors for the notes and effects in your samples. At the same time, you can lock colors, flashes and blur for the notes and specify the speed, count, expansion and size of the particles representing them. The background can also be personalized with horizontal and vertical lines, digits and keyboard. Irrespective of whether you are composing music or are looking for a tool to help you create visual effects for the mixes and track you come up with, MIDI Visualizer can come in handy. This is a working version of the WaveGlow. The new version lets you edit the parameters on the go and will let you save the presets for additional tweaking later on. I also fixed a small bug where the preset names were not saved on exit. The WaveGlow is an applet based effect, that uses the delay algorithm of Apple's SoundBoard plug-in to simulate the effect. It's in development state, currently it doesn't support a lot of the functions of the SoundBoard plug-in, but it's a very useful effect for laying down sounds and effects in a relatively easy way. The WaveGlow is compatible with QuartzAudio, so it works on OSX 10.6+ and iOS 5+. (and iOS is required to launch the applet) The preset list can be rearranged by dragging the sliders to the desired spot, this list is saved in
