Using Photoshop for Video When the term "digital camera" was coined in the 1980s, it was a relatively low-cost way to photograph. Creating videos with Photoshop

Photoshop is a perfect program for any type of shooting, from still photography to video. Chapter 3

provides information on importing and exporting video from a camera. In this section, I show you how to work with video as a still image. Photoshop offers a variety of ways to work with video. You can incorporate live-action footage and add special effects to the video so that it looks more professional. Additionally, you can create videos for use with your videos in Adobe After Effects. Photoshop has a built-in timeline that enables you to edit your videos directly in the program. You can

access the built-in timeline by choosing Window?Timeline from the menu bar or pressing Ctrl+T (+T) on the keyboard. This timeline holds clips and layers of your video, enabling you to build the perfect shot easily. When you view the video, you can drag any part of the timeline with the pointer. You can create new layers or split existing ones and you can also cut and copy. When you exit the timeline, you can close the project window or return to your main image if you prefer. These video editing tools

work in the same way as the still editing tools, so the first thing to do is learn the editor commands — which I explain in the next sections. Snapping video to the timeline You can select any video clip in your project and drag it to the timeline to place it. If you place the cursor over any of the video frames, a small curved arrow appears to tell you which frame is selected. To quickly jump to any video frame, use the spacebar or the Esc key (you

Characterization of the FBJ
murine osteosarcoma oncogene.
FBJ murine osteosarcoma (F/F)
encodes a protein (F-1) with
extensive homology to the
transforming gene v-Fos from
Abelson murine leukemia virus
(Ab-MuLV). The protein F-1, a
product of the fb1 locus, has
transforming properties in

fibroblast cell lines. The fusion of F-1 to viral envelope glycoprotein gp70 leads to the expression of a membrane protein (FP-1) that induces cell transformation.

Sequence analysis of the fb1 locus shows that it encodes three proteins, designated F-1, F-2 and F-3. Here we describe the cDNA and genomic structures of the F-2 gene and demonstrate its precise transcriptional initiation site, the presence of multiple transcriptional enhancers, the lack of extensive alternative splicing and the enhancer-

specific utilization of exon-intron splicing signals.
