I have an array of 64 colors stored in a UIColor in my project. I need to make a UIView in which I can choose the colors from the array and make the image to have the color of the color chosen by the user. I have a button with a color picker, but when I choose the color in the color picker, the UIView is black. Any idea about how to solve this problem? A: Here is a small sample of how you could do this in the delegate method of the button: -(void)buttonPressed:(UIButton*)sender { [sender setBackgroundColor:[self.colorsArray[1] colorWithAlphaComponent:1]]; } Q: Team Foundation Server - Rename Projects & Delete old projects? Does anyone have a script or suggestion to clean out older projects on a Team Foundation Server database? I have a team of developers that creates tons of projects. Most of them end up not needed anymore and get deleted later on. But we have like 30 projects that have never been accessed by a user and are just sitting there, occupying lots of space in the database. Is there a way to delete all the inactive/unused projects? If there is, it would be a nice to have some kind of list that you can put all of your unused projects in and have a script/tool that cleans them out so they can be deleted. It would be nice to automate this kind of work so the developers don't need to manually delete the unused projects. I'm looking for a way to do this that's automated. A: It sounds like you're looking for a TFS Power tool. You can build your own solution using the TFS Power tools. There's a community that has prebuilt some scripts you can download and use. Here's one that's listed as 'Active' but it will definitely give you a starting point. Send this page to someone via email U.S. President Donald Trump said Friday he doesn't want the U.S. 4bc0debe42
