Checking a local file system for errors Files have always been essential to the running of a computer. Most of the time, they are found in the hard disk or a server where they are used for storage and the retrieval of information. However, it is also important to know what is going on with the files. For example, what is the status of your documents, or where are they stored. Windows provides the much needed tools to check for file errors. Some of the features of these tools are described below. Disk checking: The DiskCheck tool is included in the Windows operating system. It is designed to check your disk for errors, and to fix the errors. This tool is useful when there are file or system errors that occur frequently. It may also be able to fix a booting problem caused by a bad sector or a cluster-locking error. The Disk Check tool can be run from the Start menu under the Search section. When you run the tool, the screen may show that the tool is currently running, or that there are some problems. The tool offers the option to scan your disks on a sector-by-sector basis. It is also possible to set the number of times that the tool should run, and the number of disk drives that can be scanned. If the results are not satisfactory, the DiskCheck tool allows you to easily remove the sector that caused the error. If the problem is a cluster-locking error, the tool allows you to attempt to fix the cluster-locking problem. There is also the option of changing the administrator password. The Checkdisk tool is similar to the DiskCheck tool. It is included in Windows NT 4.0, 2000, and 2003, but not in Windows 95 or 98. In addition, the tool does not support running disk checks on several volumes. This tool is used to check for and fix a wide range of errors, such as disk hard disk errors, errors on the NTFS volumes, broken file systems, corrupt files, bad clusters, damaged volumes and logical volumes. It can also fix the booting problem caused by a bad sector or cluster-locking error, and also remove 80eaf3aba8
