This study aimed to determine risk factors associated with auditory outcome, complications, and hearing outcomes in patients with acoustic neuroma (AN) undergoing cochlear implantation (CI). Patients with AN who underwent CI were evaluated. Data were collected regarding demographic characteristics, hearing and tumor characteristics, and the results of medical and surgical treatment. The cochlear implantation results were assessed using the Categories of Auditory Performance (CAP) and the Speech Intelligibility Rating (SIR) test, according to the year of CI, and the predictive variables associated with the outcomes were identified using the binomial logistic regression model. Sixty-nine patients underwent CI and their mean age at CI was 57.1±11.4 years (range 24-85 years). Univariate analysis showed a significant difference in the CAP scores between the pre- and post-CI year groups (p a1d647c40b
