Through a series of interactive activities and videos, you will be introduced to important concepts in the study of educational research, including the value of inquiry and the goals of education, as well as key terms related to scientific methods. As you explore the ethics of educational research, you will examine the use of various information technologies, including computers, the Internet, virtual learning environments, social networking sites, mobile phones and PDAs. This is

a research-based course, with emphasis on student participation and interaction. The course is part of a special theme area for research that has been developed by an international group of educators. For more information, visit: Why Choose Lumen? OAQM brings the benefits of a long lifetime and a high storage capacity of spin-based memory. In addition, the memory can be multiplexed for higher data rate. A report on the development of OAQM was published online by the journal Nature Photonics. In digital holography, a hologram of an object is recorded on a CCD. In real-time DH, the hologram is then electronically reconstructed by scanning the CCD array. Researchers from Stanford and QuTech in the Netherlands have used the real-time DH technique to image submicron thick absorbing sample structures, and achieved the first real-

time DH hologram of a submicron object with measurement fidelity exceeding 90%. Real-time DH, in which a single photon is used to probe the sample instead of a coherent beam, is more compact, faster, and more efficient than traditional DH with coherent beam. However, real-time DH has the limitation of being unable to store any information of the photon. In a spin-based quantum memory, such as spin-wave memory or hybrid spin wave/photon memory, a qubit stored on a spin is entangled with a photon. The photon and the
