To reduce the adverse effects and increase the success of the ketogenic diet (KD) in children with intractable epilepsy and to provide a better understanding of the mechanisms of action of KD. Ketogenic diets, also referred to as ketogenic therapies or ketogenic diets, can be used to treat epilepsy in various types of epileptic syndromes in children. Recent data suggest that the long-term efficacy of KD is associated with improvements in seizure control and the quality of life and that the diet improves neuropsychological development and results in earlier development of language skills. There are over 60 different types of epilepsy in children, each with unique pathophysiology and response to treatments. KD is a safe and effective treatment that offers an alternative to antiepileptic drugs (AEDs) in children with intractable epilepsy. It is a valuable treatment that can be given in the preadolescence, adolescence, or young adult years, and the goals of the diet can be achieved in various types of epilepsies.Media playback is unsupported on your device Media caption Children pay tribute to victims
