The incidence of complications after partial cystectomy for superficial transitional cell carcinoma of the bladder: a 3-year prospective single-institution study. We studied the incidence of postoperative complications in patients with bladder cancer treated with partial cystectomy. The study included 102 patients with superficial transitional cell carcinoma (TCC) of the bladder and were consecutively enrolled. Clinical and pathological characteristics, operative data, and follow-up results were analyzed. The mean follow-up was 45 months, and 7.8% of patients developed postoperative complications. Of 26 patients with low-grade tumors, 14 (54%) had complications, as compared with 18 of 75 (24%) with high-grade tumors, $P = 0.028$. On the other hand, there was no significant difference between the complication and recurrence rates. In patients with high-grade tumors, only smoking >20 pack-years was identified as a significant risk factor for developing complications. In patients with low-grade tumors, obesity (body mass index (BMI) >30) and obstructive uropathy were identified as important risk factors for developing complications. Although partial cystectomy has a
