Understanding Photoshop layers The way you construct images in Photoshop is essentially a layered process. You create your basic image and then add on layers, such as one for painting a word on the image, or for adding a drop shadow to the image. Finally, you use layer masks to give an element some transparency or opacity or to mask off areas of the image. So you can make significant changes to an image with just a few layers and very little effort. Whether you work with the program directly or with a third-party program that lets you export images directly into Photoshop, you create your image by first drawing on or setting up a background, which is called the _canvas_ in Photoshop. Then you apply color, texture, and other effects to the canvas to create a finished image. When you create a new file in Photoshop, a default canvas is added, and you're given the opportunity to select any of several different backgrounds to use as a starting point.

Q: Continuous function composition $(f\circ g)^\ast = g^\ast\circ f^\ast$? If X,Y,Z are vector spaces, I would like to know if there is some easy way to prove that if $f,g\colon X\to Z$ are continuous and $g^\ast\colon Z^\ast\to X^\ast$ is the inverse of g then the continuous function $$(f\circ g)^\ast = g^\ast\circ f^\ast$$ holds. I would like to know this because I need to show it for a given example and I have no idea how to do it, so I'd like to know a systematic way. A: Actually, it's a theorem of continuity that $f\circ g : X \to Y$ is continuous if and only if $g\circ f : Y \to X$ is continuous. This is because the relevant function spaces are isometries, meaning that $\|f(x) - f(y) \| = \|g(x) - g(y)\|$. In particular, if $g : X \to Y$ is continuous, then g is injective (all points in X are sent to the same point in Y) and $\langle g(y), g(x)\rangle_Y = \langle y, x\rangle_X$. If $\langle g(y), g(x)\rangle_Y = \langle y, x\rangle_X$, then $g(x-y) = 0$ for every x,y, so g is also surjective. So if $f : Y \to Z$, $g : X \to Y$, and $g\circ f : Y \to X$ is continuous, then the composite $f\circ g : X \to Z$ is continuous, and since the original function $f : Y \to Z$ is continuous as well, then $f\circ g$ is continuous too. Likewise, if $f : Y \to Z$, $g : X \to Y$ is continuous, then $g\circ f$ is continuous, and since $g : Y \to X$ is continuous, then $

Q: Is it possible to see what's in an ArrayList that is initialized in an object? I have the following code: class Clicker implements Runnable { private ArrayList mArrMous; private int mX; private int mY; public Clicker(ArrayList mArrMous) { this.mArrMous = mArrMous; } public void run() { while(true) { Iterator iIt = this.mArrMous.iterator(); Mouse m = iIt.next(); mX = m.getX(); mY = m.getY(); this.toGame(mX,mY); } } } class Main { public static void main(String[] args) { ArrayList mArrMous = new ArrayList(); Mouse m1 = new Mouse(1,2); mArrMous.add(m1); Mouse m2 = new Mouse(3,4); mArrMous.add(m2); Mouse m3 = new Mouse(5,6); mArrMous.add(m3); Mouse m4 = new Mouse(7,8); mArrMous.add(m4); new Thread(new Clicker(mArrMous)).start(); } } class Mouse implements Runnable {
