Note Both Photoshop and Lightroom are available as a part of the Creative Suite, but Lightroom is technically a separate program. If you're interested in learning about Lightroom in more detail, read our book _Adobe Lightroom: Mastering the Essential Digital Photography Workflow_ (Adobe Press) from the Techniques for Advanced Photoshop Users chapter. ## Resizing Images Before you can make any changes to your images, you must first resize them to the correct size for your end use. It's common to resize images for printing, web use, or email transmission. Not all images are meant to be edited and it's important to resize images properly so they look good in the end. If you want to retouch your photos, you can't simply open them in Photoshop and automatically see an immediate difference in their appearance. Instead, you need to edit your images so that they look better, and that's only possible if you resize them.

This page shows the most basic configuration details for all ELF filehandlers in the ReCVA (ReScripted Video Archiver) system. This page is, in essence, the "fast-track" documentation for creating and using ELF filehandlers. How to Create A New Filehandler The first step is to create a new filehandler named whatever you wish in the appropriate library. Here's the simplest approach: 1. Find or create a new ELF filehandler Look in the library specified by LIBNAME. If that doesn't work, look in LIBNAME_DIR. Create a new filehandler named my_new_filehandler 2. Add the filehandler to the ReCVA system Create a new ReCVA configuration object with the name of the ELF filehandler. Here's an example with a Libre/open source video filehandler: 3. Set the properties and Run the program The ELF filehandler now can be used. The next step is to set the properties for the ELF filehandler. These properties are not exposed in the graphical user interface, but they are still used by the ELF filehandler. To do this, simply call the set_priv properties like this The properties set by the set_priv function apply immediately. Be sure to call set_priv at some point to save them. If everything works fine, the program will quit with an OK. You can now discard the filehandler and it will be lost. To make multiple filehandlers available, repeat the steps above for each filehandler. The only difference will be that a different library name is used for each filehandler. Some Video Filehandlers The following video filehandlers currently exist in the ReCVA system. Libre/open source video filehandler Description Creates a new Libre/open source video filehandler. Additional Information The Libre/open source video filehandler creates a new video filehandler that loads the BINK formatted video data. The BINK (Binary Intermediate Network Stream) format is a standard file format for storing video information. DVF (Digital Video Format) filehandler Creates a new DVF video filehandler. Additional Information The DVF (Digital Video Format) file

Zinc-catalyzed cyclization of 3-(1H-pyrazolo[3,4-c]pyridin-3-yl)-1-azabut-2-en-4-ones: concise synthesis of imidazo[1,2-a]pyridines and 2,4-dihydro-1H-imidazo[4,5-c]quinolines. A series of novel 5,6-dihydro-imidazo[1,2-a]pyridines and 2,4-dihydro-1H-imidazo[4,5-c]quinolines has been prepared by a cyclization of 3-(1H-pyrazolo[3,4-c]pyridin-3-yl)-1-azabut-2-en-4-ones to give 7-azaindole derivatives. The catalytic cyclization reaction of 3-(1H-pyrazolo[3,4-c]pyridin-3-yl)-1-azabut-2-en-4-ones can be accomplished by use of a catalytic amount of zinc chloride in solvents such as ethyl acetate, DMF, and THF. The zinc-catalyzed cyclization of 3-(1H-pyrazolo[3,4-c]pyridin-3-yl)-1-azabut-2-en-4-ones is initiated by the direct formation of zinc-complexed alkyl radicals.Graphene Oxide/Carbon Foam Composite with Large Electroactive Surface Area for Supercapacitor Application. A novel graphene oxide/carbon foam (GO/CF) composite was synthesized by in situ deposition of graphene oxide nanosheets on CFs. Due to the synergistic effects of the porous structures of CFs and the conductive networks of graphene, the as-synthesized GO/CF composite exhibits an excellent supercapacitive performance, with a high areal capacitance of 471 mF cm-2 at a current density of 2 mA cm-2 and a high charge/discharge rate of 10 mA cm-2. The superior electrochemical properties of the GO/CF composite have been further elucidated by characterization of its specific surface area, morphology, chemical composition, and pore structure using
