Here are five Photoshop tips for the professional photographer. Laying it out in layers One of the most powerful features of Photoshop is the ability to edit each layer separately. Layers save the image by allowing each section of the image to be edited separately. This allows the image to be repainted or retouched with the background removed in one section and added to another. A more detailed description of how to create layers is available in Book II, Chapter 3. Editing text Photoshop's best-selling feature is its ability to manipulate text. The program uses a special editing language that allows authors to change the font, size, and alignment of text in the document. Depending on the business, it's also a common practice to use lowercase as opposed to capitals in business name and text (as well as the other way around), just like letters in a typewritten document. One of the most common problems found in professional work is characters that don't properly fit the page (for example, characters that extend past the edge of the page). For this reason, Photoshop includes extensive layers and tools for dealing with this common problem. In the following list, you see how to align a text box to specific points on the page: To align text to the top of a page, select Align to Page option from the Home tab's View panel. This setting inserts a rule through the text, similar to using the Type tool. To align text to the bottom of a page, select Align to Bottom option from the same panel. This setting inserts a rule through the text, similar to using the Type tool. To align text to the left side of a page, select Align to Left option from the same panel. This setting inserts a rule through the text, similar to using the Type tool. To align text to the right side of a page, select Align to Right option from the same panel. This setting inserts a rule through the text, similar to using the Type tool. To align text to the left and right, select the Crop tool from the Home tab's toolbox and drag across the entire text box. (You get the idea.) In a word, text that doesn't fit the page in the center is the worst. Photoshop includes a useful technique called floating text that can be used to fix problems like these. The process is explained in the next section. Creating floating text Floating

The incidence of penile nodular metastasis from penile cancer. A retrospective study. Penile metastases are extremely rare. This retrospective study investigated the incidence of penile metastasis from penile cancer in a series of patients. A review of surgical records and pathology archives identified all patients with penile metastases from penile cancer from 1975 to 1995. The patient and tumour characteristics, adjuvant therapy, and outcome were analyzed. Six cases of penile metastases from penile cancer were diagnosed during the study period. Penectomy with bilateral orchidectomy for tumours 4-10 mm in diameter was performed in all cases. Five of 6 patients were alive and free of disease during a mean follow-up of 31 months. One patient died of distant metastasis 11 months after penectomy. Eight cases of penile metastases from penile cancer have been reported in the literature. These findings suggest that penile nodular metastases in the Japanese population should be considered a complication of a primary penile tumour.# Copyright (C) 2016 Antoine Granthon # This file is distributed under the same license as the testsuite package. msgid "" msgstr "" "Project-Id-Version: testsuite 1.0.0 " "Report-Msgid-Bugs-To: " "POT-Creation-Date: 2013-01-11 17:11+0100 " "PO-Revision-Date: 2017-01-18 12:00+0100 " "Last-Translator: Antoine Granthon " "Language-Team: " "Language: FR " "MIME-Version: 1.0 " "Content-Type: text/plain; charset=UTF-8 " "Content-Transfer-Encoding: 8bit " "Plural-Forms: nplurals=2; plural=(n > 1); " "X-Crowdin-Project: testsuite " "X-Crowdin-Project-ID: 17754 " "X-Crowdin-Language: FR " "X-Crowdin-File: testsuite.pot " "X-Crowdin-File

Q: Labeling TikZ nodes in a matrix I am making an abstract graph using TikZ where each node (marked in the image) has an x-coordinate and y-coordinate. I'm trying to label the node with the coordinates, however the following code doesn't work. \documentclass[12pt,letterpaper]{article} \usepackage[margin=0.5in]{geometry} \usepackage{tikz} \usetikzlibrary{matrix,positioning} \usepackage[all,node]{xy} \begin{document} \begin{tikzpicture}[scale=.6] \def {1} \def\m{1} \matrix[matrix of nodes,nodes in empty cells, draw] (m) { ode[draw,xshift=-10] at ($ (m-1-1)!.25! (m-2-1) $) {$N(1)\;\leftarrow\:n\:\vrule\:m\:\rightarrow\:\emptyset$} ; & \foreach \i [count=\j from 1,evaluate=\i as \x using int(\i)] in {2,...,\m} { \ifnum\i
