The history of Adobe Photoshop, Photoshop CS6, and Photoshop CC Adobe Photoshop CS6 is a professional photo editing software developed by Adobe Systems. The introduction of new features and features were almost constant in CS6 to keep users satisfied. In the product introduction version of CS6, which was released in August 2011, Adobe introduced a format called.HDR. In April of 2011, a new feature called the Content Aware Fill was also introduced. Other features introduced in CS6 include the addition of a color management module. In September of 2011, the support for the .HDR format was expanded so that it now supported color-managed photographic images. This release included a tool called Snap which allows users to view content in context to their editing work. A version of Mac OS X was also introduced in this version and a new feature called Content-Aware Move. CS6 also included a filter called Smart Sharpen. In 2012, Adobe released Adobe Photoshop Elements 12. This version allowed users to edit RAW images, as well as perform some basic image retouching. In addition, Adobe brought back the name Photoshop Elements, rather than Elements, as the name of the edition software. The development team refined the program to provide the basic capabilities of Photoshop. In 2013, Adobe introduced Photoshop CC, which allows users to edit images and create new images without having to go through the process of saving the image into the file system before editing. The updated software also includes a new file format,.ai, which is available in all popular web browsers. The development process of Photoshop CC is also more in line with the other Adobe products. Adobe Photoshop CC is now compatible with both Mac OS and Windows operating systems, which is good news for users who are using a Mac or Windows laptop. Adobe Photoshop Elements 13. In known casting methods, a casting mold is positioned with respect to a casting rail and lowered along a vacuum-assisted path onto the casting rail where a metal casting is formed by displacement of the casting mold along the casting rail. At least one casting device is provided for this purpose. Said casting device is arranged on the casting rail and has a first mold part and a second mold part which are movable relative to each other and which form between them a mold cavity for the metal casting. This mold cavity is, as a rule, closed off at its rear-side end by the first mold part, and, as a rule, at its front-side end by the second mold part. The displacement of the two mold parts is effected such that the first mold part is moved along a casting rail, a vacuum chamber is used for removing air from the mold cavity, and the metal casting is displaced under high pressure and under the effect of the suction of the air to be removed from the mold cavity. In order to reduce the casting costs, use is made of metal-casting molds that have a plurality of mold cavities arranged in series, said mold cavities being connected to one another along a common vacuum line, and of a plurality of displacement devices that are connected in series to the casting rail and provide for the displacement of the casting mold. In a first or upstream mold cavity, the casting part that is to form the metal casting that is desired and that is to contain the metal melt will usually be arranged on the casting rail. The casting part or the metal melt can be brought into direct contact with one or a plurality of sections of the casting rail, with the aid of which the casting mold is displaced along the casting rail. In the case of a brinell casting mold, the mold cavity comprises a rear-side mold part and a front-side mold part, the mold cavity in this case being closed off at its rear-side end by the rear-side mold part, which, as a rule, is formed of steel, and at its front-side end by the front-side mold part, which is formed of a refractory material, in particular ceramic. In a second mold cavity, the casting part that is to form a casting that is downstream of the first casting part, i.e. a casting part that is formed of a different metal melt than the first casting part, is usually arranged. The casting parts can each be displaced in a displacement direction and/
